

Data Preservation for Bankruptcies in the Mortgage Lending Sector

Digital Mountain's unique electronic discovery capabilities for the mortgage lending sector enable value to be harnessed in bankruptcy, workout or reorganization matters. As part of this process, important data may need to be identified, preserved and potentially exchanged for review. Our process allows database-backed applications to be able to be viewed and to provide efficiencies for both the loan origination and the secondary mortgage market. Examples include data that needs to be viewed from Fiserve, Calyx Software, DRI Management Systems or other mainstream software applications used in the mortgage sector. Digital Mountain has specialized expertise to deal with complex data environments and applications that may be encountered.

Because of the nature of the data, third parties may need assistance making files from mortgage lending applications viewable. We also can fill the gap that may exist when a predecessor company no longer has an active IT department or the IT department is in transition, but data is still looking to be maintained. Harnessing this intellectual property properly can reap substantial benefits in preserving the value of an organization when trying to resell or divest assets in the secondary market while still complying with laws for securing financial records.

We also offer a Web-based application, FileQuest, for filtering and reviewing data for more than 400 file types without having the applications that created them. Using an Internet Explorer browser and an Internet connection, FileQuest enables distributed teams of reviewers to collaborate to find key information that may otherwise be missed.
