

# Computer and Cyber Forensics for the Enterprise

If you're a member of the global investigations/ data security group, corporate legal department or HR team of your organization, Digital Mountain can help you achieve your goals. We offer incident response services on a case-by-case basis or as an ongoing extension to your team. Examples of how we can help your company include:

- A former company employee took a proprietary customer list. Digital Mountain uses its data forensics techniques to search the hard drive for deleted history, Internet e-mail remnants and other data artifacts. As a result, evidence is found that the employee took company proprietary information.
- Credit card information is stolen from a server at a major e-commerce company. Through our cybersecurity group, we can track down the perpetrator, assist in fixing the security hole and collaboratively work with counsel.

Because Digital Mountain is not wedded to internally-developed tools, we can use the most effective solution for our computer forensics or cyber forensics analysis. Additionally, we can provide decryption services to access password-protected files and hard drives to the greatest extent possible.

Our incident response services offer you 24x7 data forensics assistance. When an incident occurs with an employee or an outside intruder, it is imperative that the chain of custody is preserved and the integrity of the data is kept intact. Digital Mountain can ensure that proper procedures are performed to manage these incidents. We will examine security holes and discover the who, what, where and when of a computer-related incident. Digital Mountain also provides third-party expert witness testimony.

Beyond data forensics, Digital Mountain provides data wiping services through our SecureWipe™ offering to ensure that all files that were meant to be deleted are actually erased. With many companies now implementing document retention plans for the digital world, it is imperative that enterprises also have data shredding in place.
